1 New functionality

HLR integration

The new version allows the use of HLR/MNP data to ensure accurate calculation of message rates. Now, when making HLR requests, the System can automatically take into account the recipient's location and service provider, allowing the most appropriate rate to be applied.

Benefits of the new functionality:

- Accurate rate calculation: the calculation of message rates is based on up-to-date data about the recipient's location and carrier, which minimizes errors
- Cost reduction: partners pay for messages based on up-to-date data, which eliminates overpayments due to incorrect routing or outdated information about the recipient

NOTE: The price of HLR requests is currently not calculated. The feature will be available in future versions.

Increased file upload limits

Possibility to upload files up to 100mb has been added when importing contacts.

Dashboard

The interval for displaying statistics has been increased from 30 to 180 days.

Contract companies

When creating a contract company it is now possible to select only one payment system of each type.

Campaign and Templates

Significant improvements have been made to the *Campaigns* interface, that include the following:

- Moving to step 3 in Campaign Wizard is no longer available if the group does not contain contacts
- Numbers starting with "+" are now supported when launching a campaign with contacts from a file

Purchase & Finance & Payment Systems

Export of details for transactions with *Campaign* and *API* types has been implemented.

Statistics

In the EDR tables, the *MCC*, *MNC*, *Country*, and *Net* columns have been separated by client and vendor.
